UNIVERSITY OF MISSOURI PRESS

POLICY ON THE USE OF AI IN PUBLICATIONS

Like many other publishers, the University of Missouri Press does not allow artificial intelligence (AI) tools such as ChatGPT or large language models (LLMs) to be listed as authors of our publications. The emerging consensus of scholarly organizations, including the Committee on Publication Ethics, is that AI tools do not meet the requirements for authorship since they cannot assume ethical and legal responsibility for their work.

Our authors must represent to the press and to readers that their work is original and that the content of other authors is cited appropriately. As AI is not the work of the author, those authors who use AI tools to produce text or images/graphics, or to collect data, must inform their editors of this use and be transparent about it in their manuscripts so that readers understand the role of these tools in the development of the work.

Authors are fully responsible for the content of their manuscripts, including any portions produced by AI tools, and are liable for any ethical breaches that may result from the use of such content.
